

# SOLAR RADIATION RECEIPT AT THE EARTH'S SURFACE

Influences on the amount:

- \*
- \*
- \*

## Motions of Earth

A. **Rotation of Earth** =

- 1.
- 2.
3. At equator: 1070 mph
4. rotation rate =

B. **Revolution of Earth**

1. period is \_\_\_\_\_ solar days
2. Gregorian calendar: \_\_\_\_\_ days. \_\_\_\_\_
3. \_\_\_\_\_ around the sun and \_\_\_\_\_

C. Astronomical terms:

1. **Perihelion:** \_\_\_\_\_
  - a.
2. **Aphelion:** \_\_\_\_\_
  - a.
- 3.

## Why the Earth has Seasons...

D. \_\_\_\_\_

1. The Earth presently has a \_\_\_\_\_ from vertical
2. This influences the \_\_\_\_\_ received at the surface.

Copyright © 2005 Pearson Prentice Hall, Inc.

**Terminology:**

- \* **Plane of the Ecliptic:**
- \* **Circle of Illumination:**
- \* **Subsolar point (declination):**

***Astronomical Seasonal Midpoints and Daylength***

**1. Summer Solstice:**

- a. occurs around \_\_\_\_\_
- b. sun overhead at \_\_\_\_\_
- c. Latitudes north of \_\_\_\_\_ - daylight \_\_\_\_\_; south of \_\_\_\_\_ ( \_\_\_\_\_ ) have \_\_\_\_\_

**2. Winter Solstice:**

- a. occurs around \_\_\_\_\_
- b. sun overhead at \_\_\_\_\_
- c. Latitudes south of \_\_\_\_\_ - daylight the \_\_\_\_\_ ( \_\_\_\_\_ ); latitudes north of \_\_\_\_\_ ( \_\_\_\_\_ ) - \_\_\_\_\_

**3. Equinox:** \_\_\_\_\_

- a. \_\_\_\_\_
- b. \_\_\_\_\_
- c. sun overhead at \_\_\_\_\_

\*\*\*\*\*

***Solar Elevation Angle and Solar Intensity***

**1. Solar Altitude (elevation angle) (NSA or *a*):**

2. To compute this, we need:

- 
- 

*we will do this in lab*

**\*\*Zenith Angle (*z*):**

*we will do this in lab also*

**2. Solar Intensity**

\* The angle of the sun's rays determine the \_\_\_\_\_ received at the \_\_\_\_\_

- \*
- \*

## SOLAR RADIATION

A. Radiation is \_\_\_\_\_ and a method of \_\_\_\_\_.

Radiation does not need a \_\_\_\_\_ to \_\_\_\_\_; energy from the sun travels through the \_\_\_\_\_.

B. Unit of energy: \_\_\_\_\_

### *Facts and Concepts of Radiation*

A. Energy propagated in the form of \_\_\_\_\_

B. One property of radiation is its \_\_\_\_\_. From the sun, there are a wide range of \_\_\_\_\_ ( ).

C. Amount of energy carried by each individual \_\_\_\_\_ (particle) varies with \_\_\_\_\_.  
\*

D.

### *Radiation Laws*

1. The wavelength of peak radiation depends upon \_\_\_\_\_.

**Wein's Law:** demonstrates that as temperature of body \_\_\_\_\_, wavelength of maximum emission \_\_\_\_\_ (to \_\_\_\_\_).

Calculations:

$\lambda_{\max}$  = wavelength \_\_\_\_\_

2. Hot objects emit \_\_\_\_\_ energy than cold objects

**Stefan-Boltzmann Law:** demonstrates that as the temperature \_\_\_\_\_, the total amount of radiation \_\_\_\_\_ rapidly.

## INCOMING SHORTWAVE (SOLAR) RADIATION

\* Solar radiation reaches us in \_\_\_\_\_, traveling at about 300,000 km (186,000 miles) per second over the distance of 150 million km (93 million miles) to earth.

\* How much of the sun's energy do we receive?

\* \_\_\_\_\_ of the total radiation emitted by the sun is received by the earth

\* The amount of solar radiation is \_\_\_\_\_ when it reaches the top of the Earth's atmosphere.

Solar Constant =  $1.96 \text{ cal/cm}^2/\text{min}$  or  $1372 \text{ W/m}^2$

How much reaches the surface?

Atmosphere acts as a \_\_\_\_\_.

### *Factors controlling radiation receipt...*

1.

2.

3.

4.

a. if it continues to the surface, it is called \_\_\_\_\_

b. if it is directed back out to space it is called \_\_\_\_\_

\* shorter wavelength ( ) are \_\_\_\_\_

\* dusty atmosphere \_\_\_\_\_

\* sunrise / sunset: sun's rays must travel through \_\_\_\_\_

\_\_\_\_\_

5. Reflection: \_\_\_\_\_ or \_\_\_\_\_ ( $\alpha$ ) defined as:

$$\alpha = \frac{\text{reflected}}{\text{incident}} \times 100\%$$

Average albedo of Earth/Atmosphere is \_\_\_\_\_; hence \_\_\_\_\_

### Factors Influencing Albedo

1.

- a.
- b.

2.

- a.
- b.

\* Water

- a.
- b.

### TERRESTRIAL RADIATION (\_\_\_\_\_)

A. Earth \_\_\_\_\_ in the \_\_\_\_\_ part of the spectrum.

B. \_\_\_\_\_ because Earth \_\_\_\_\_ than sun.

C. Called \_\_\_\_\_, \_\_\_\_\_, or \_\_\_\_\_

D. Earth's temperature is 300K so  $\lambda_{\text{max}} =$  \_\_\_\_\_  $\mu\text{m}$  (\_\_\_\_\_).  
Earth's radiation has 20x longer wavelength than radiation from the sun.

### HEAT BALANCE

\* All objects radiate energy. . . so why doesn't everything get colder?

•

\* At night, an object get colder; \_\_\_\_\_  
Vice versa for objects warming.

\* \_\_\_\_\_ :

- \* The Earth and sun act like \_\_\_\_\_
- (1) At all times, \_\_\_\_\_
  - (2) Earth is also constantly \_\_\_\_\_
  - (3) Assume no other methods of heat transfer so if rate of \_\_\_\_\_ = rate of \_\_\_\_\_ then Earth is in a state of \_\_\_\_\_
- \* For Earth: the \_\_\_\_\_ temperature is \_\_\_\_\_
- \* At the present time, the average global temperature is \_\_\_\_\_
- Why is there a difference???
- \*
- \* For example, \_\_\_\_\_ and \_\_\_\_\_ absorb \_\_\_\_\_ radiation, but are \_\_\_\_\_ absorbers of \_\_\_\_\_ radiation. These are the \_\_\_\_\_.
- \* Kirchoff's Law: states that \_\_\_\_\_ are \_\_\_\_\_ at a particular wavelength and \_\_\_\_\_ are \_\_\_\_\_ at the same wavelength. Especially true for \_\_\_\_\_ and is responsible for \_\_\_\_\_.
- \* They also emit radiation in the \_\_\_\_\_ wavelength. The radiation that returns back to the surface is called \_\_\_\_\_.
- \* This process makes the lower atmosphere \_\_\_\_\_.
- \* This is the \_\_\_\_\_.
- \* Enhancement of this effect by \_\_\_\_\_.
- \* This could lead to \_\_\_\_\_.

## COUNTER-RADIATION

- A. CO<sub>2</sub>, water vapor, etc. \_\_\_\_\_ radiation \_\_\_\_\_ and \_\_\_\_\_.
- B. Act as \_\_\_\_\_ for Earth
- C. \_\_\_\_\_ is readily absorbed by atmosphere in contrast to \_\_\_\_\_.
- D. \_\_\_\_\_ is best known as the \_\_\_\_\_.

## RADIATION BALANCE

A. **Net radiation ( $Q^*$ )** is the \_\_\_\_\_.  
 It is computed as the \_\_\_\_\_ minus radiation \_\_\_\_\_  
 the earth

B.  $Q^* = S_{dn} - S_{up} + L_{dn} - L_{up} = \text{net radiation}$ , where:

$S_{dn} =$

$S_{up} =$

$L_{dn} =$

$L_{up} =$

C. Annual Radiation Balance

1. Equator:
2. Poles:
3. Are the tropics getting hotter and the poles getting colder?
4. \_\_\_\_\_. The \_\_\_\_\_ and to a lesser extent the \_\_\_\_\_  
 act as giant thermal engines that \_\_\_\_\_

\* Balance achieved by \_\_\_\_\_. HOW?

-

-

-

### Earth's Annual Energy Balance

\* Earth's overall average equilibrium temperature \_\_\_\_\_  
 from year to year

\* Earth/Atmosphere must \_\_\_\_\_  
 \_\_\_\_\_

### Earth-Atmosphere Energy Balance

Radiation fluxes alone: \_\_\_\_\_ with \_\_\_\_\_ at  
 the surface and \_\_\_\_\_ in the \_\_\_\_\_

Sensible heat ( \_\_\_\_\_ + \_\_\_\_\_ / \_\_\_\_\_ )  
 + latent heat \_\_\_\_\_ the imbalance in the Earth's energy system.

Energy \_\_\_\_\_.
